# Description

Gather allows users and groups to quickly organize and post location-based events.

In contrast to Facebook's events, Gather is meant for quick, informal, and impromptu meetups. Think Snapchat, for events.

# Targeted Users

- Anyone
- Mainly for groups of friends to plan informal meetups
- Could be used in other settings such as groups for planning for sports teams, clubs, or any other event.

# Highlights of application

Gather has a very visual interface, and users are able to easily navigate the site with just the click of their mouse.

Clicking on an event will open the location in Google Maps to provide the user with directions.

## What was easy

- HTML/CSS
- User interaction with events and groups
- Google Maps integration

## What was hard

- Models - we had our own User and Group models. This required a Profile model to associate extra data with users
- Editing and creating users - required modifying both models together
- Image uploads

# Future work

- New user signup
- Password recovery
- Notifications
- Friend request system
- Chat rooms for friends, groups, and events
- Mobile app
